

# **A Low-Cost Innovative Approach for the Fabrication of Net-Shape SiC Components for Mirror Substrates**

**Sponsored by:**

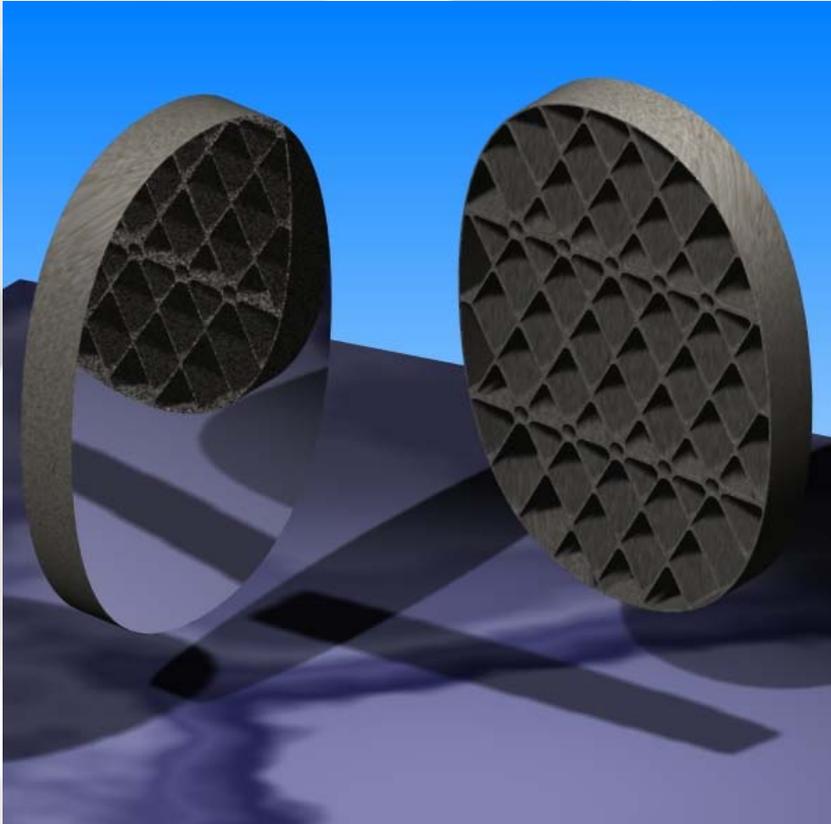

**The Missile Defense Agency  
Contract #F29601-03-M-0287**

**Principal Investigator:**

**Dr. Abuagela H. Rashed  
Sr. Materials Scientist  
Poco Graphite, Inc.  
Decatur, TX 76234**

# Opportunity

---

**SiC Mirror Substrates Recently  
Manufactured by POCO**

- Beryllium is being phased out due to mounting health concerns and cost.
- There is a need for a new replacement material with comparable properties desirable for optics applications.

# Selection Criteria

---

- **Property requirements as compared to beryllium such as specific stiffness, thermal stability, etc.**
- **Property Comparison of Candidate Materials**
- **Ease of Complex Net-Shape Manufacturing**
- **A Low Cost Manufacturing Process**

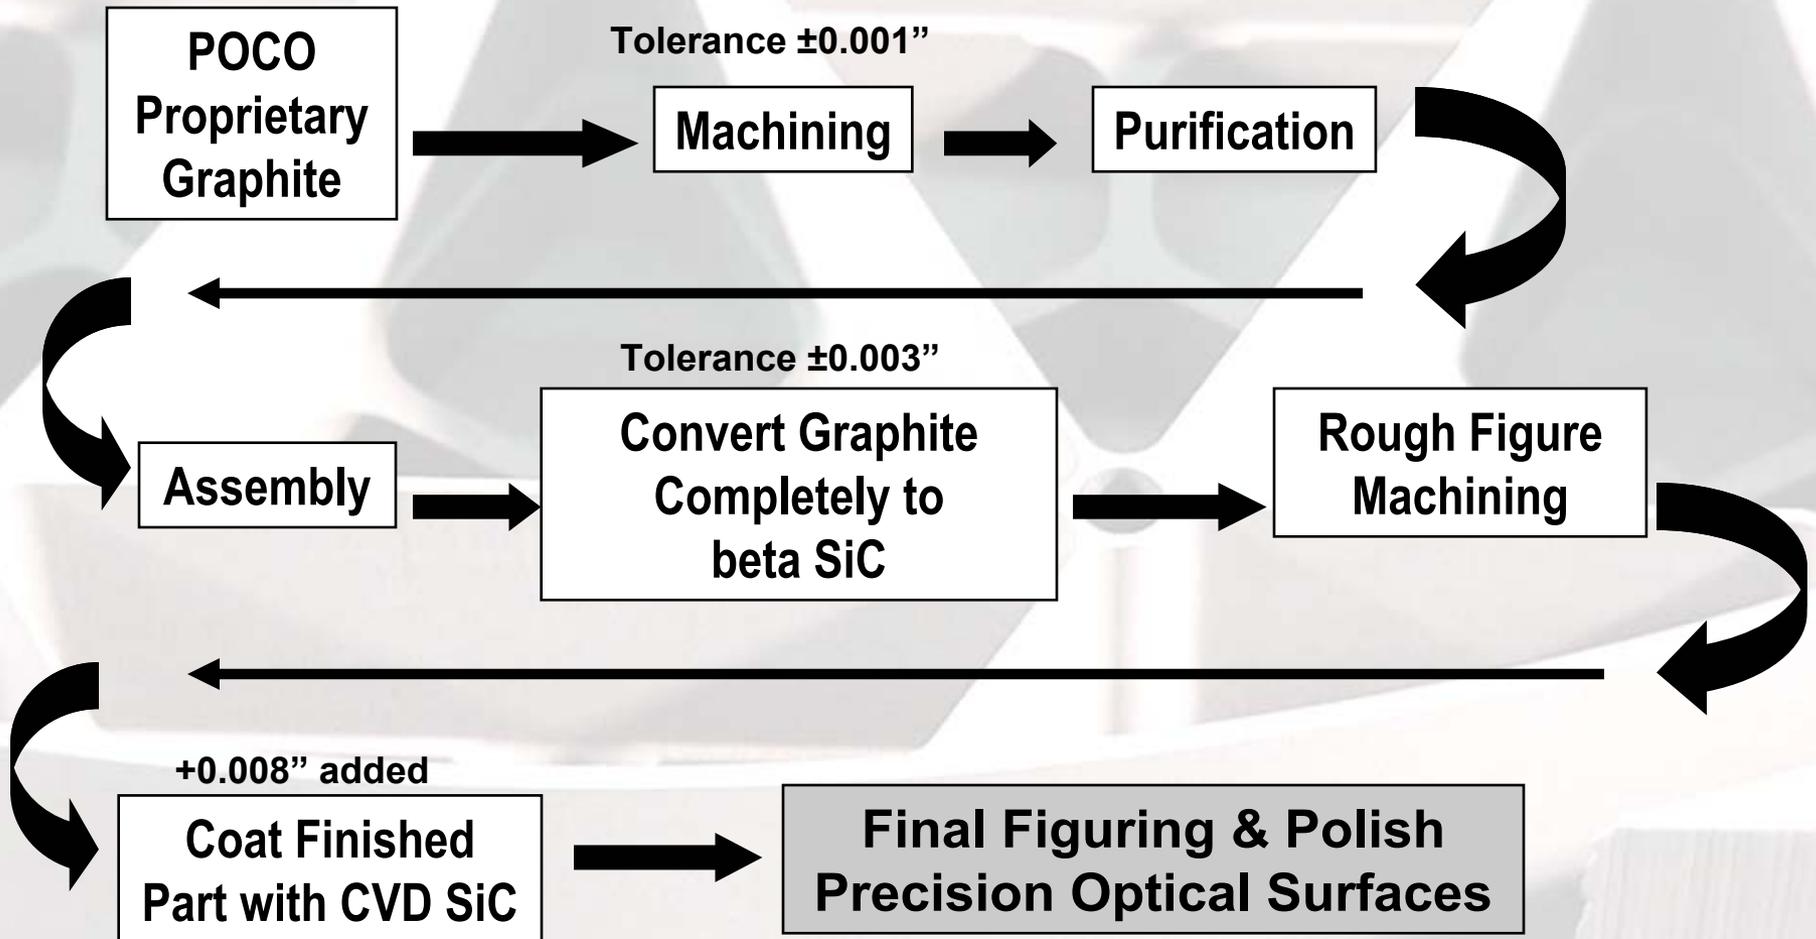

# Property Requirements for Materials in Optics

<b>Low</b>	<b>High</b>	<b>Benefit</b>
<b>Density</b> ( $\rho$ )	<b>Elastic Modulus (E)</b>	<b>High Specific Stiffness (<math>E/\rho</math>)</b>
<b>CTE (<math>\alpha</math>)</b>	<b>Thermal Conductivity</b> ( $\kappa$ )	<b>High Stability Factor (<math>\kappa/\alpha</math>)</b>
	<b>Thermal Diffusivity (D) &amp; Heat Capacity (C)</b>	<b>High Thermal Conductivity</b>
<b>Poisson's Ratio</b>	<b>Strength &amp; Fracture Toughness</b>	<b>Long-Term Stability</b>

# Material Property Comparison

Material	Density ( $\rho$ )	Elastic modulus (E)	Thermal expansion ( $\alpha$ )	Thermal conductivity ( $\kappa$ )	Specific Stiffness (E/ $\rho$ )	Thermal Stability Parameter ( $\kappa/\alpha$ )

# POCO SuperSiC™ Process

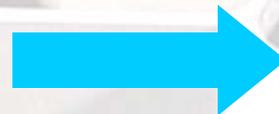

# SUPERSiC™ Conversion Process

**Purified,  
Net-Shape  
(Machined)  
Graphite**

**Polycrystalline,  
Stoichiometric  
β-SiC**

**No Additives  
(High Purity)**

# POCO Manufacturing Capability

---

POCO has been supplying different industries with numerous SiC products, such as wafer carriers, of high purity and excellent mechanical and thermal properties

# Advantages of POCO's Process

---

- **Manufacturing capability**
  - ◆ Near net-shape - Consistent dimensional changes as a result of C  $\Rightarrow$  SiC conversion and CTE change
  - ◆ High shape complexity due to ease of graphite machining - Comparable to Aluminum
  - ◆ Low cost due to absence of tooling charges and post machining
- **High purity due to absence of any additives**
- **Short lead time due to the unique nature of the process**
- **POCO engineers and produces own graphite for conversion to SiC**
  - ◆ Continuous improvement
  - ◆ SiC properties can be controlled by controlling graphite properties
  - ◆ Quality control is under our control.

# Objectives and Benefits of the Proposed Work

---

## Objective:

- ◆ Develop a post process for the DENSIFICATION of POCO's porous SuperSiC™ material without sacrificing near net-shape manufacturing capability.

## Benefit:

- ◆ Capability of producing dense near net-shape SiC products with cost/performance attributes comparable to other commercially available SiC products.

# Outline of the Proposed Process

---

- Produce the desired near net-shape porous SuperSiC™ part using POCO's conversion process (No development needed)
- Impregnate the part with a carbon precursor mixture, the composition of which is to be developed in this Phase I; cure and pyrolyze
- Repeat impregnation cycle, if needed, ⇒ The result is a carbon structure with interconnected microporosity residing in the open pores of the part to be densified.
- Infiltrate with silicon to convert the carbon to SiC resulting in a net-shape dense SuperSiC densified with the new RFSC phase.
- Apply CVD SiC coating or silicon cladding, if needed.

# Phase I Work Plan

---

- Define mirror requirements (Raytheon)
- Prepare porous SiC preforms and test specimens
- Select an array of resin compositions most suitable as the carbon precursor
- Develop impregnation conditions and prepare carbon-impregnated samples
- Develop silicon infiltration conditions
- Characterize RFSC-Densified samples for density, porosity, strength, stiffness, fracture toughness, thermal conductivity, CTE, microstructure & free Si
- Final technical report in addition to monthly progress reports

# Some Preliminary Results as Compared to SuperSiC™

Property	As-Converted (SuperSiC™)	SiC-Densified (Proposed)
Bulk Density, $\rho_b$ (g/cm <sup>3</sup> )	2.53	3.07
Total Porosity, $P_t$ (%)	20	
Open Porosity, $P_{op}$ (%)	18-19	0
Flexural Strength (MPa/ksi) <i>m is Weibull modulus@ RT</i>	147/21.3 (m=17)	200/29-275/40 <b>(up 36-87%)</b>
Tensile Strength (MPa/ksi)	129/18.7 (m=16)	
Young's Modulus, E (GPa/msi)	218/32	375/54 <b>(up 72%)</b>
Specific Stiffness, $E/\rho_b$ (kN-m/g)	85	121 <b>(up 42%)</b>
Poisson's Ratio, $\nu$	0.17	
Dynamic Shear Modulus, G (GPa/msi)	96/14	
Fracture Toughness, $K_{IC}$ (MPa·m <sup>0.5</sup> )	2.3	
Hardness (kg/mm <sup>2</sup> )	2000	
Thermal Conductivity, $\kappa$ (W/m·K)	170	
Mean Coefficient of Thermal Expansion (CTE), $\alpha_m$ (10 <sup>-6</sup> /K)	@ 500°C	4.0 <sup>(1)</sup>
	@ 1000°C	4.4 <sup>(1)</sup>
	@ 25	1.2 <sup>(2)</sup>

# Further Development

---

- Demonstrate repeatability of the developed process
- Scale up the process for the densification of complex shapes and large parts
- Test the developed process for the manufacturing of SiC fiber-reinforced SiC matrix composites
- Demonstrate the CVD SiC coating of densified plates and their polishability
- Develop correlation between material properties and mirror performance

# Commercialization and Other Applications

---

- POCO will continue to support the development of the proposed process and the commercialization of the produced SiC material
- In addition to optics, there is a definite need for a dense low-cost SiC material for a number of other applications such as in the semiconductor industry where corrosion resistance is desirable

# Summary

---

- Silicon carbide is the material of choice to replace Beryllium
- POCO's process has the advantage of manufacturing capability to produce complex shape SiC products at lower cost
- POCO has the advantage of producing own graphite for conversion to SiC ensuring a continuous quality control
- Although POCO's SuperSiC™ material has good mechanical and thermal properties needed for optics and other applications, there is still room for improvement via the proposed densification process
- Preliminary results showed a significant increase in flexural strength and stiffness for the densified SiC material

# Acknowledgement

---

- **Poco Graphite, Inc. wishes to thank the Missile Defense Agency for funding this Phase I program**
- **POCO is looking forward to working with Dr. Arup Maji (Technical Monitor), AFRL/VSSV, Kirtland AFB, NM, and utilize his technical support and guidance towards achieving the objectives and goals of this project**
